

# AubieSat-I

Auburn University's First Student Built  
Satellite

Thor Wilson, Project Manager

# AubieSat-I Mission

---

## ▶ AS-I Goals

- ▶ To develop a student satellite building capability at Auburn University
- ▶ To space test a Ga-N based UV sensor developed in the Auburn University Physics Department
- ▶ Planned on launching on a Dnepr rocket

# Management

---

## ▶ Procedure

- ▶ Define goals and objectives for the semester
- ▶ Define milestones (including reviews)
- ▶ Make a schedule
- ▶ Make a work breakdown structure (specific tasks)
- ▶ Monitor and control activities at bi-weekly meetings
- ▶ DOCUMENTATION

# Systems Engineering

Eric Grimes/Thor Wilson, Systems Engineering

# Design Philosophy

---

- ▶ Conform to all Cal Poly specifications
- ▶ Simplicity/COTS parts
- ▶ Redundancy
- ▶ All components selected through trade studies

# Functional Block Diagram

# Mass Budget

Subsystem	CBE	CBE + 10%	Initial estimate
ADC	48	53	110
C&DH	60	66	60
COMM	281	309	150
PAYLOAD	10	11	70
EPS	150	165	160
STRUCTURE	333	366	400
Total	882	970	950

# Failure Modes Analysis

Code	Name	Description
4	Mission Failure	If this error cannot be mitigated, the mission will be a failure – no communications to the ground station.
3	Reduced Lifetime	If this error cannot be mitigated, the mission is still a success, but further research is needed to extend mission lifetime in future missions.
2	Reduced Capability	If this error cannot be mitigated, the mission is still a success, but further research is needed to provide increased capability.
1	Non-Critical	If this error occurs, the primary mission could still be accomplished without additional need for redundancy.

# Payload

Justin Van Cleave, Payload

# Purpose

---

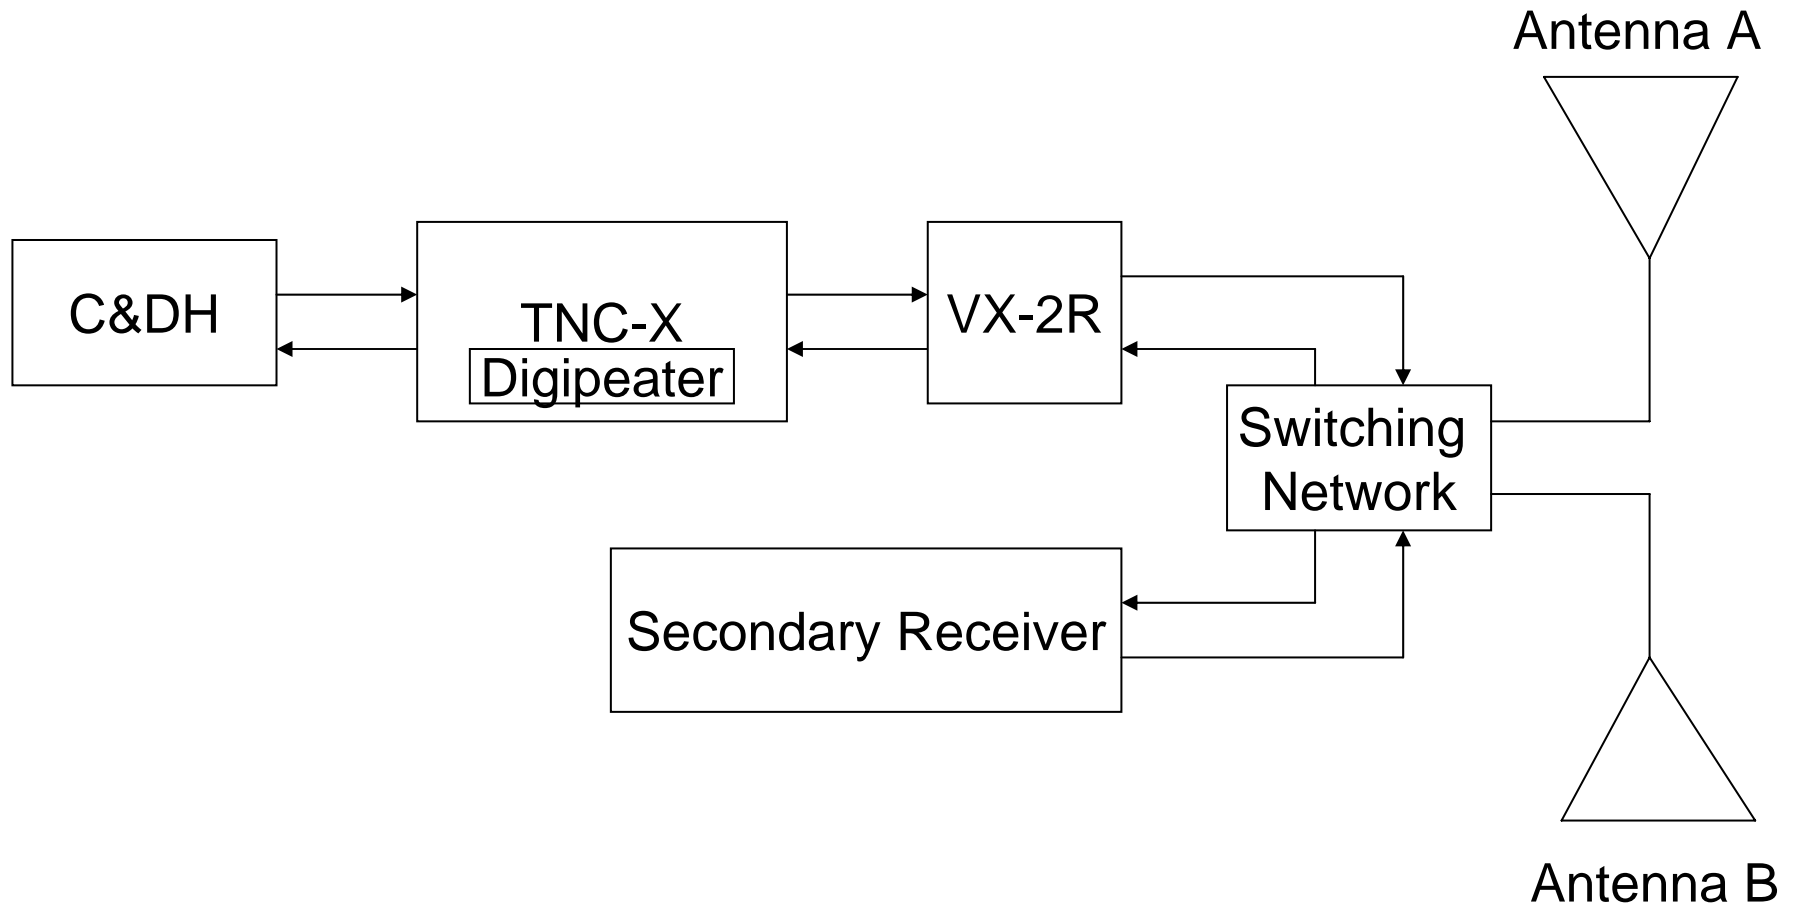

- ▶ **Effectiveness**
  - ▶ Space environment
  - ▶ Performance over lifespan
  
- ▶ **Key characteristics**
  - ▶ Responsively (325nm):  $\sim 0.1 \text{ A/W}$
  - ▶ UV/V selectivity:  $\sim 10^6$
  - ▶ Dark current density @10V:  $\sim 0.8 \text{ nA/cm}^2$

# Communications

Robert Thompson/Thor Wilson, Communications

# Functional Block Diagram

# Antenna

---

- ▶ Center feed half-wave dipole
- ▶ Amateur Band frequency 435-438 MHz
- ▶ Approximately 34 cm
- ▶ Made of Nitinol or Measuring tape

# Antenna Testing

- ▶ Configuration of half wave dipole with best test results was angle of 100 degrees between antenna arms.

# Beacon

- ▶ Done through primary communications system
  
- ▶ Function
  - ▶ Help tracking
  - ▶ Provides secondary communications
  
- ▶ Two Modes
  - ▶ Data beacon – Short burst of data from TNC-X
  - ▶ Morse code beacon – C&DH keys VX-2R to create Morse code

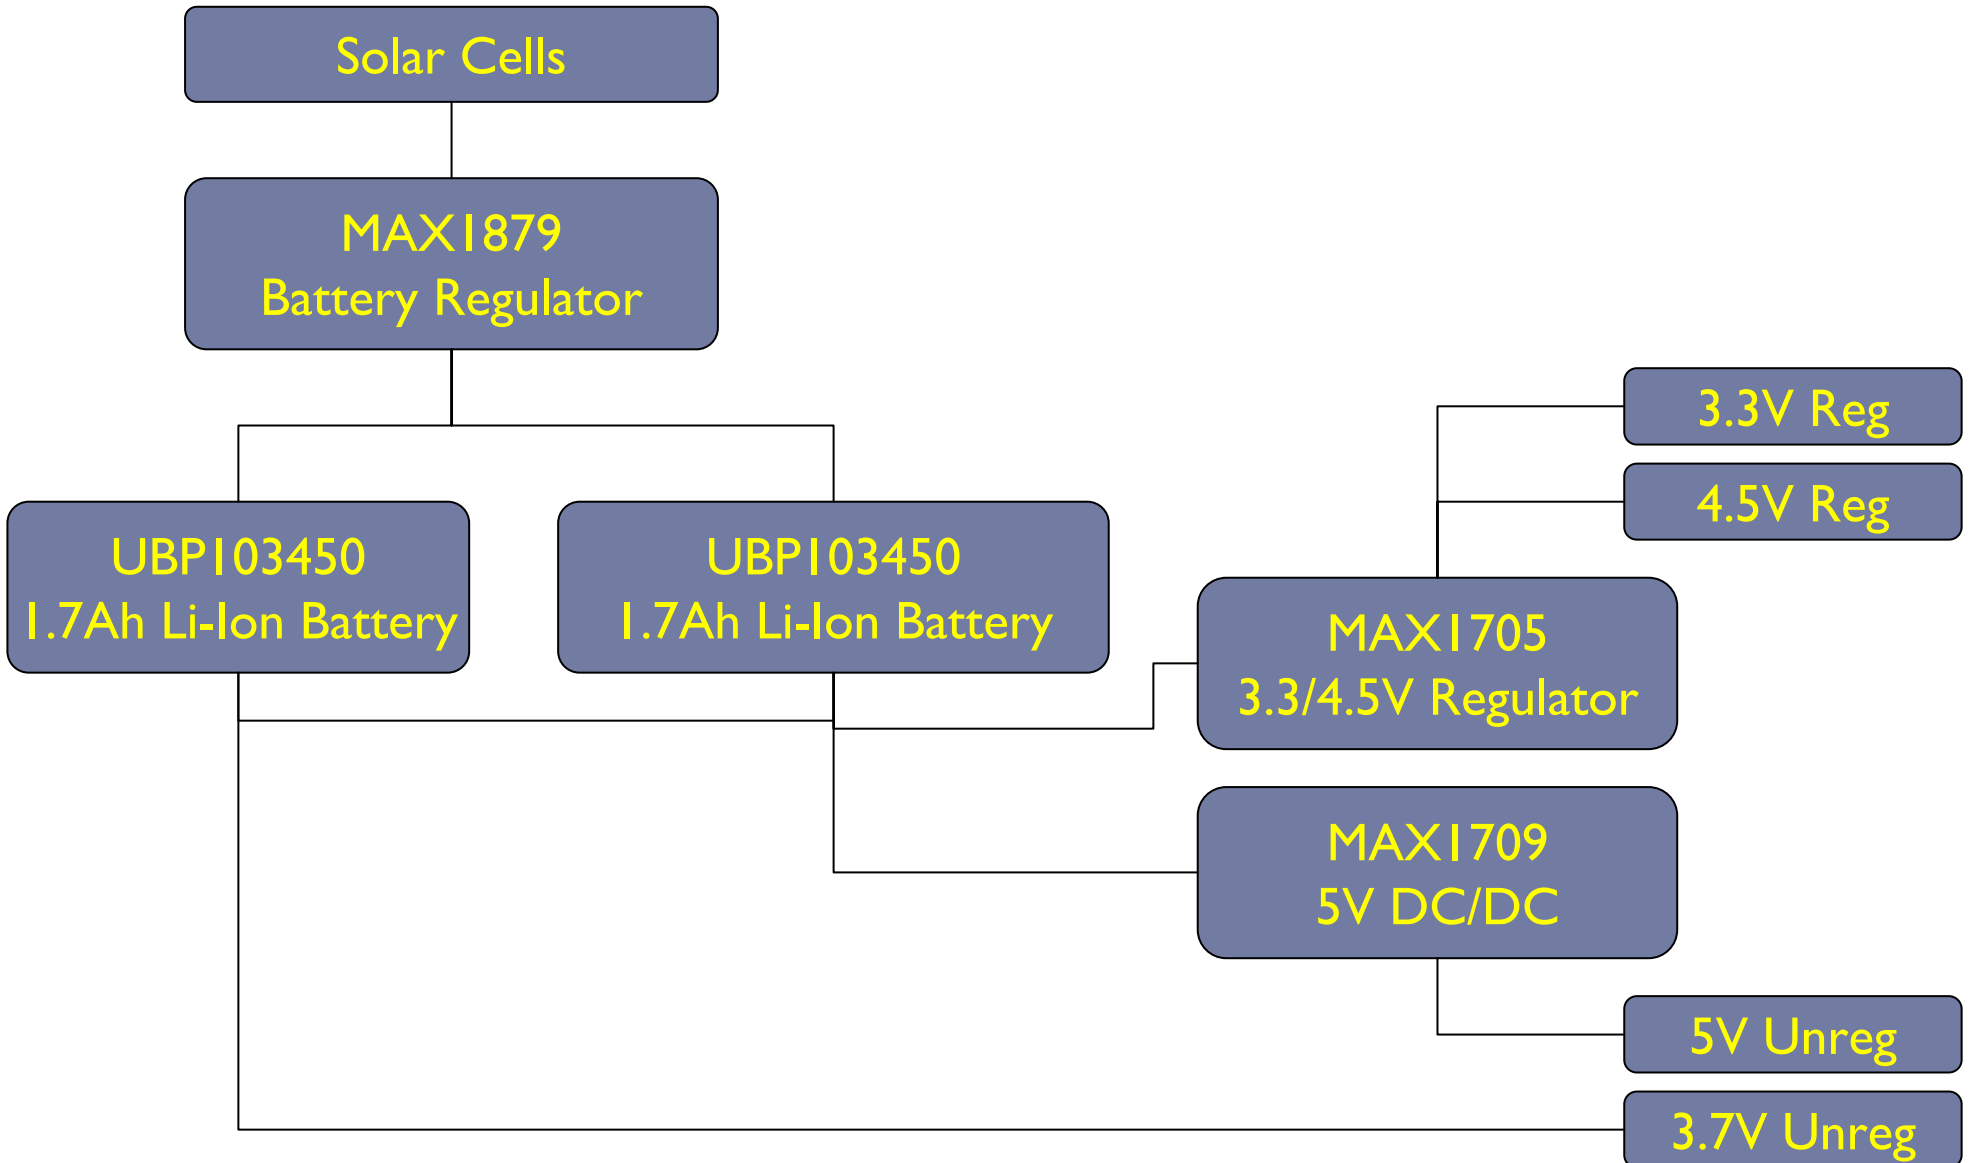

# Electrical Power System

Michael Carroll, EPS

# Block Diagram

# Attitude Determination and Control

Justin Van Cleave, ADC

# Purpose of Control

---

- ▶ Provide proper orientation primarily for communication
- ▶ Passive magnetic control
- ▶ Hysteresis Dampening to help control

# Orientation of Magnet

- ▶ After antenna testing was complete the ideal orientation of the magnet was determined

# Attitude Determination

---

- ▶ Passive system requires no determination
- ▶ Use of “coarse sun-sensor”
  - ▶ Based on data transmission constraints
  - ▶ Get experience with determination

# Structures & Mechanisms

Zach Johnston/Neil Dougherty, Structures

# Interior Structure

- Stackable
- Antenna deployment 1
- EPS
- C&DH
- Batteries
- TNC-X and VX-2R
- Secondary receiver
- Antenna deployment 2

# External Structure

Side Plate to Bottom Plate Assembly

## BOTTOM PLATE

- ▶ Support boards with 9.4 mm standoffs with hole to run 10 cm bolt through
- ▶ Run bolts through the top plate and boards and fasten bolt to the bottom plate. Boards are secure to these plates

## SIDE PLATES

- ▶ Four side plates with solar cells screw in to top and bottom plate
- ▶ Cutouts for antennas and data port

# Antenna Deployment Mechanism

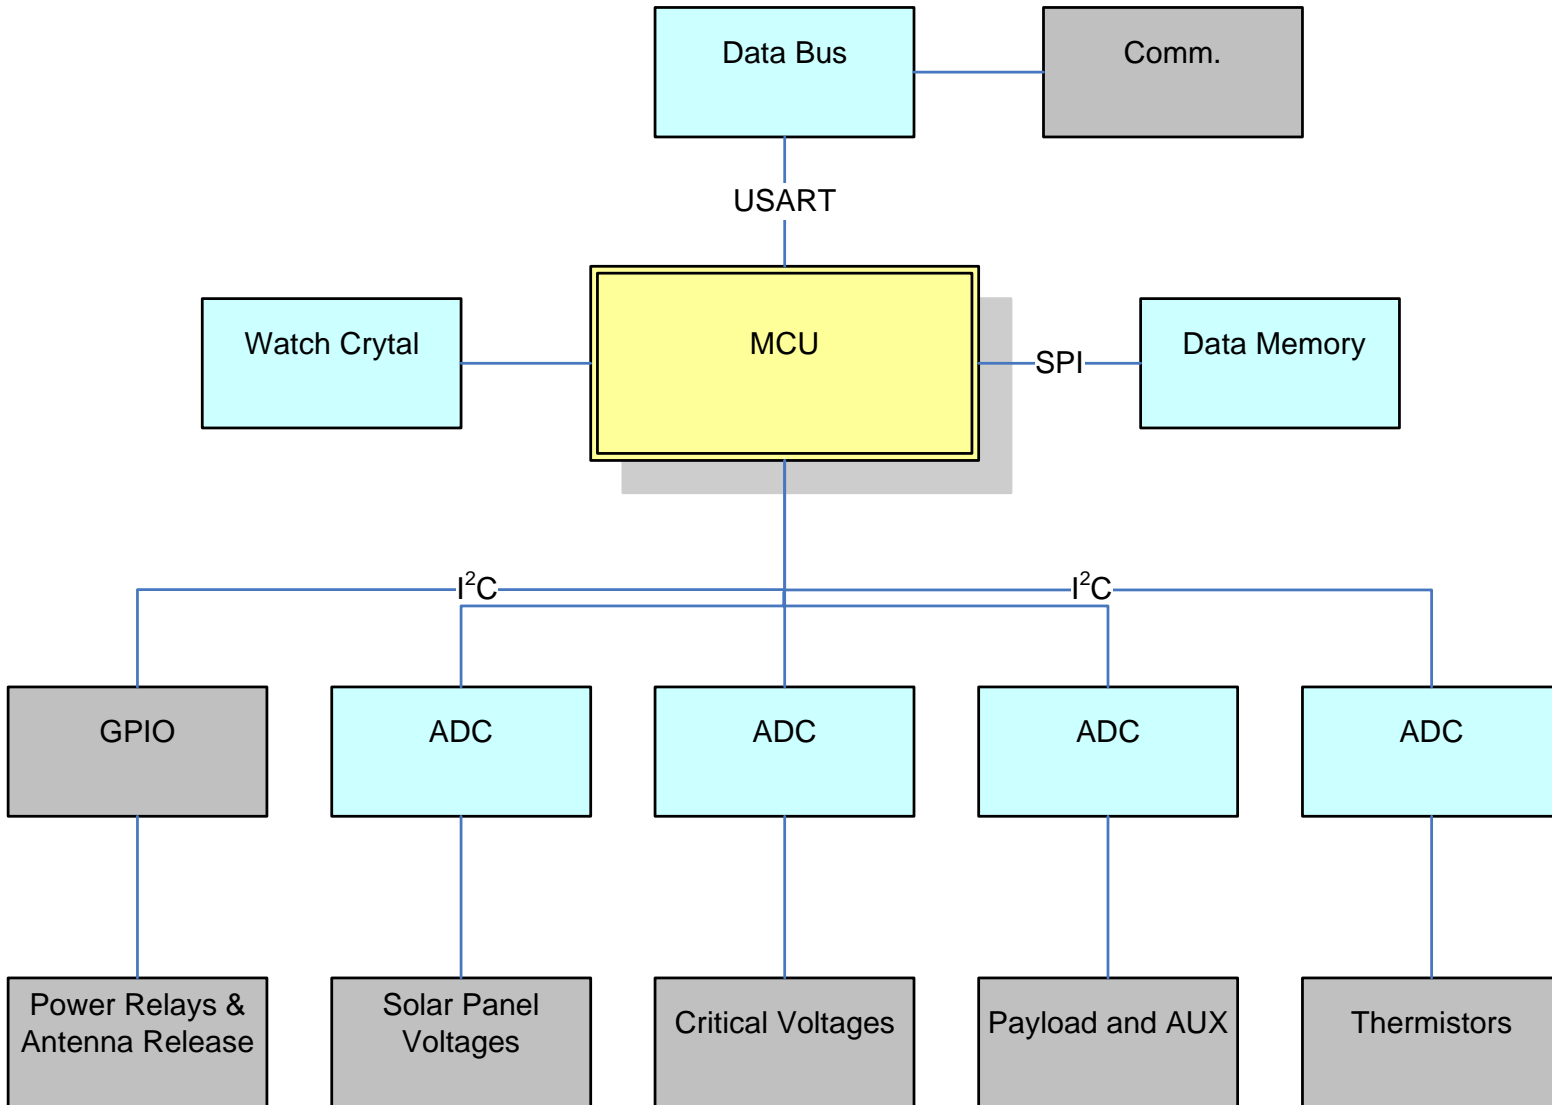

# CAD Model

# Command & Data Handling

Brad Dutton & William Woodall

# Block Diagram

# ATmega2561L

- ▶ 256kB program storage
- ▶ 8kB internal SRAM
- ▶ Two Wire SPI
- ▶ 2.7V, 15mW
- ▶ 16 channel 10 bit ADC
- ▶ Open source WinAVR C compiler

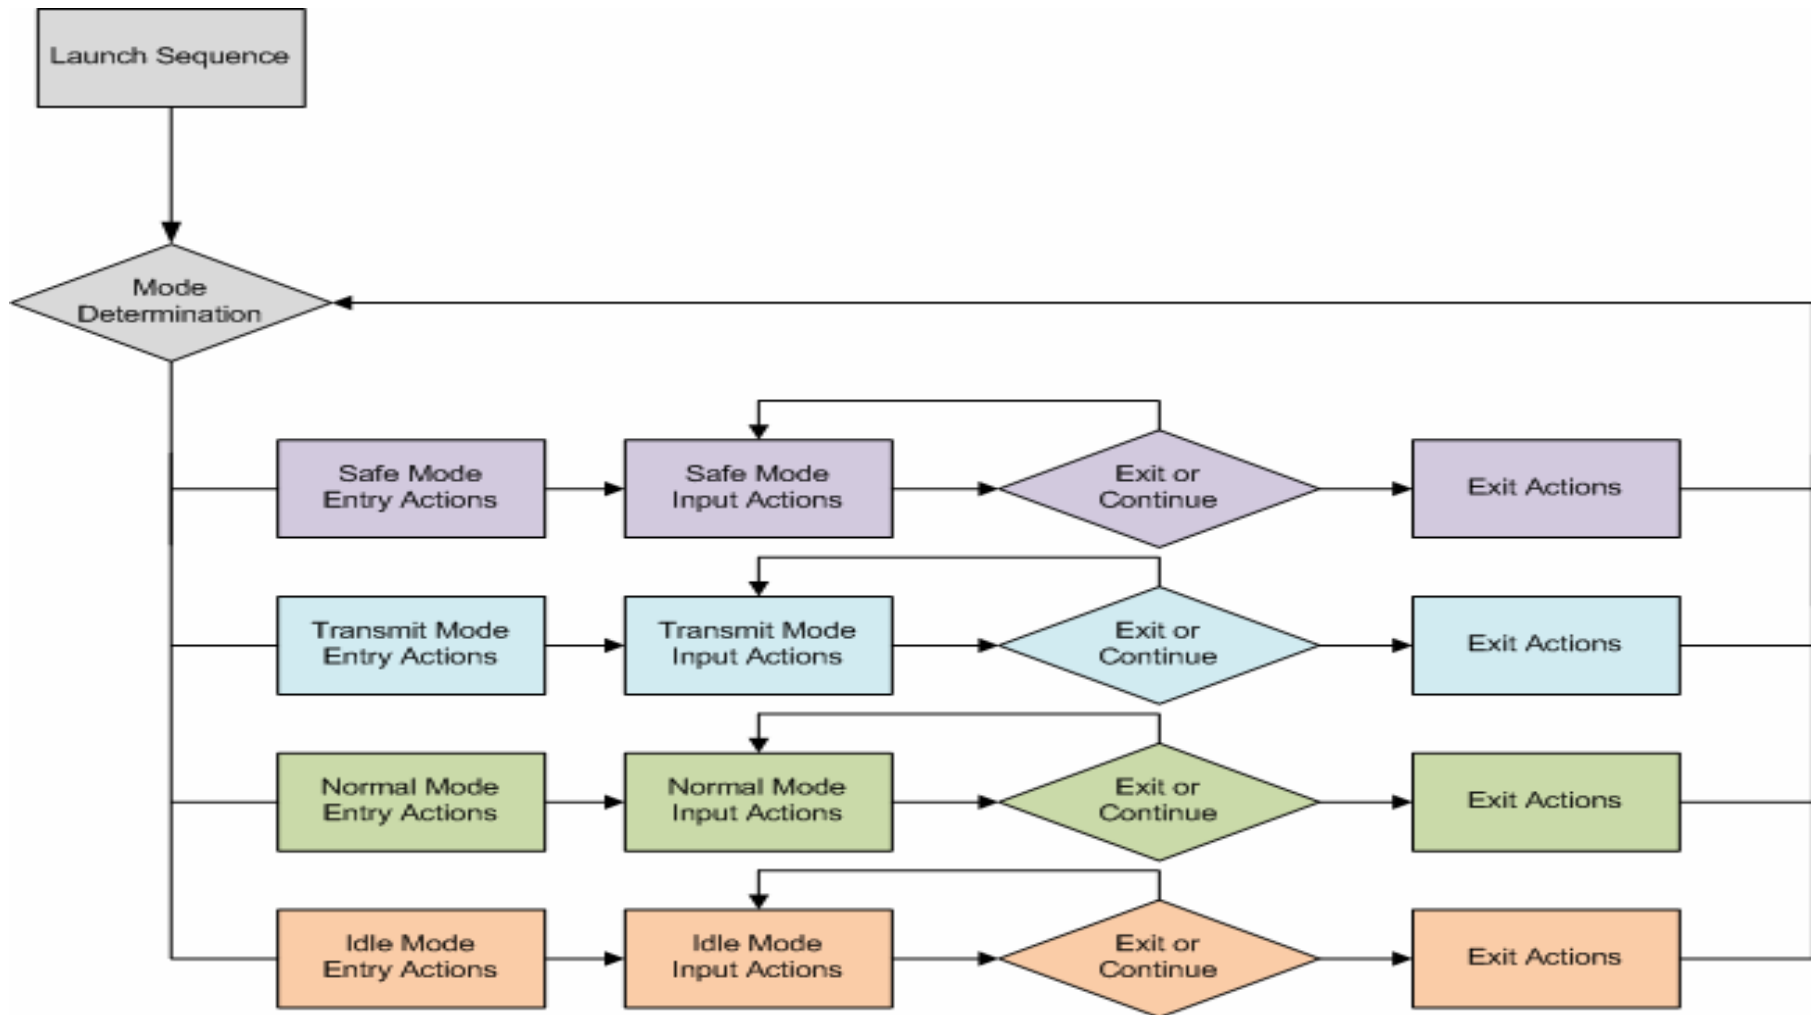

# Satellite Modes

---

- ▶ One time launch sequence
  - ▶ Four modes
    - ▶ Safe mode – C&DH is on and performs basic tasks, such as battery charging, checking vital housekeeping.
    - ▶ Idle mode – Only housekeeping electronics are on. C&DH is storing housekeeping information. Transmitting beacon.
    - ▶ Normal mode – Science experiment running, C&DH will be storing data from experiment. C&DH is collecting housekeeping data. Transmitting beacon.
    - ▶ Transmit mode – Retrieve and transmit stored data, beacon is off.
-

# The CubeSat Program

Jamie Droddy, Project Manager

# The CubeSat Program

---

- ▶ Developed by Cal Poly & Stanford
- ▶ Creates launch opportunities for those previously unable to access space
  - ▶ Low –cost launch
  - ▶ Standard Deployment System (P-POD)
  - ▶ Coordination of required documents & licenses
  - ▶ Delivery to launch facility and integration with launch vehicle
- ▶ Access to CubeSat Community

# CubeSat Specifications

- ▶ 10 cm cube (100mm x 100mm x 113.5 mm)
- ▶  $\leq 1$  kg
- ▶ Center of mass w/in 2cm of geometric center
- ▶ Thermal expansion of material similar to that of P-POD
- ▶ Electrically dead during launch
- ▶ No operation until 15 minutes after launch
- ▶ Qualified & Accepted per Cal Poly Specifications

# Amateur Radio Use

---

- ▶ FCC Licensing
- ▶ FCC & IARU regulations governing amateur satellite operation
  - ▶ Capable of killing all transmission whenever requested to do so
- ▶ Orbital Debris Mitigation Report

# AubieSat-I

Our Mission

# AubieSat-I Mission

---

## ▶ AS-I Goals

- ▶ To develop a student satellite building capability at Auburn University
- ▶ To space test a Ga-N based UV sensor developed in the Auburn University Physics Department

# AubieSat-I Mission

---

## ***Spring 2007 Goal...***

- ▶ A functional table-top prototype of AS-I
  - ▶ All subsystems powered by EPS
  - ▶ All subsystems nominally operational
  - ▶ All subsystems properly interfaced
  - ▶ Fully operational Ground Station

# Mission Analysis

Eric Grimes, Systems

# Launch, Dnepr III

- ▶ Kosmotras, Baikonour Cosmodrome (Kazakhstan – 63°E and 46°N)
- ▶ Converted RS-20 (SS-18) ICBM
- ▶ Delivery for final integration: April, 2008
- ▶ Launch date: Summer 2008!!

# Orbital Parameters

- ▶ Sun-synchronous, near polar
- ▶ Inclination:  $\sim 98^\circ$  (slightly retrograde)
- ▶ Period:  $\sim 99$  min
- ▶ Altitude:  $\sim 650$  km (LEO)
- ▶ Eccentricity:  $\sim 0.008$
- ▶ 30-35 minute eclipse time

# Systems Engineering

Eric Grimes/Thor Wilson, Systems Engineering

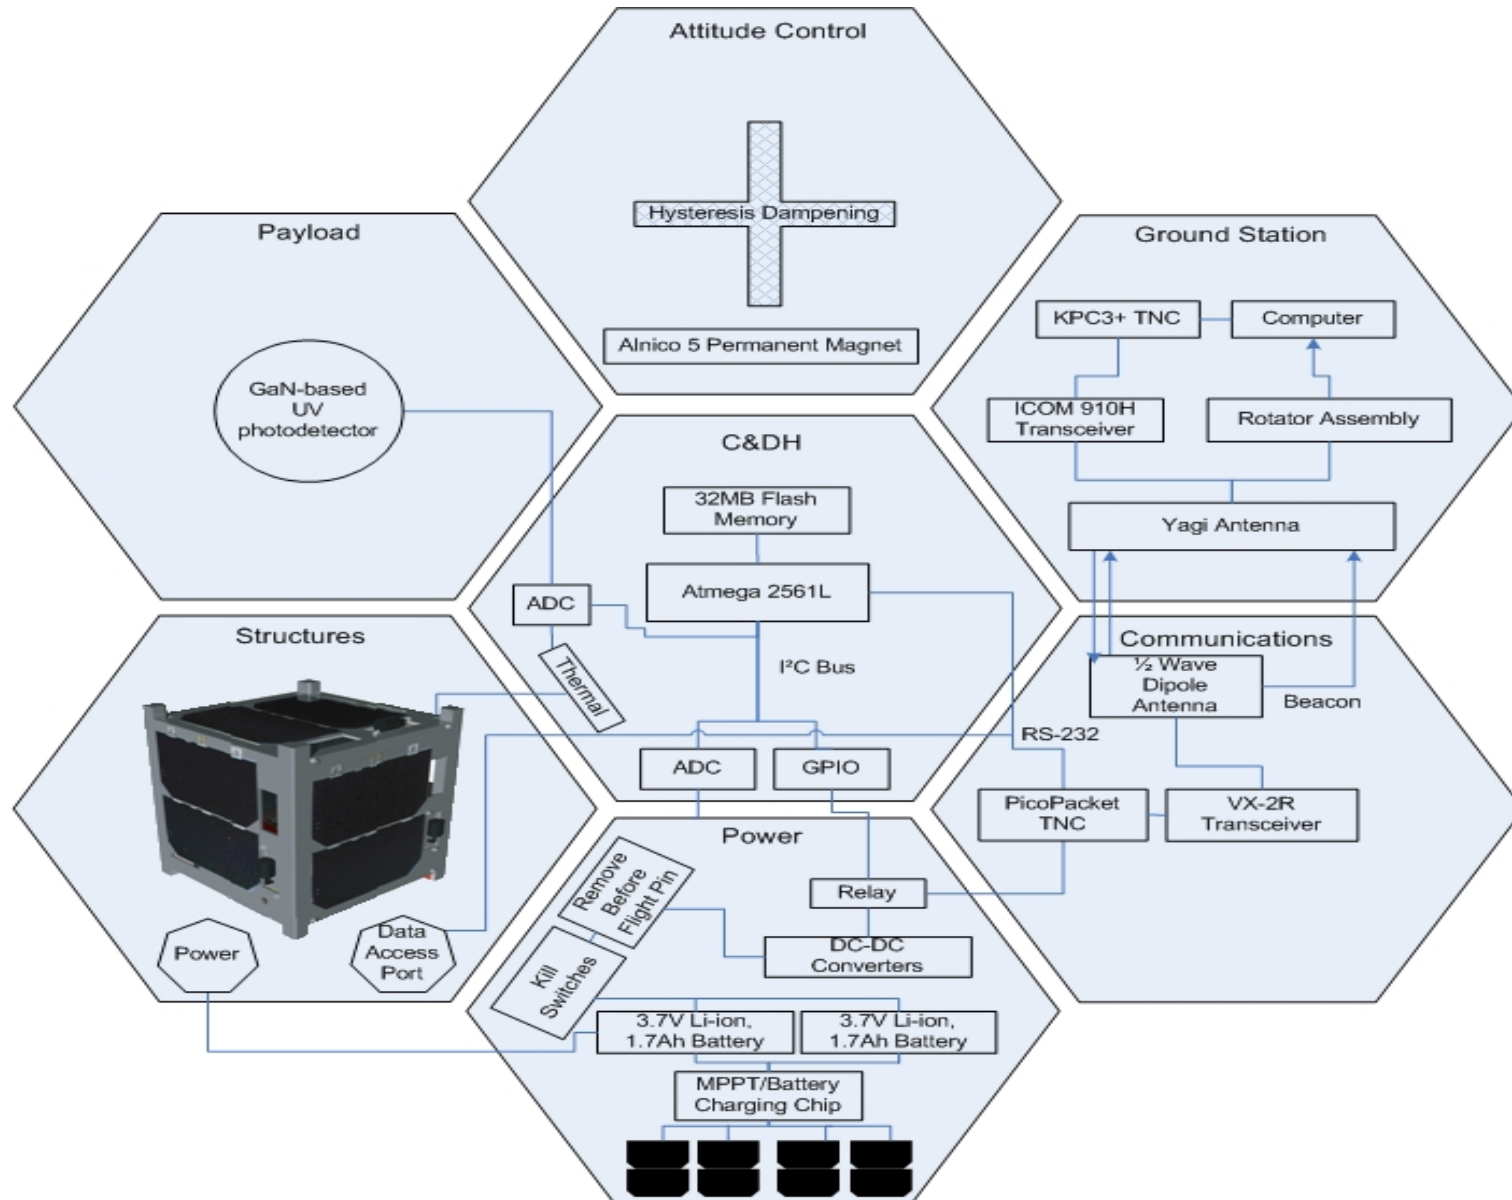

# Design Philosophy

---

- ▶ Conform to all Cal Poly specifications
- ▶ Simplicity/COTS parts
- ▶ Redundancy
- ▶ All components selected through trade studies

Duration	35 seconds	831 seconds

Bakeout Profile

# Qualification Testing

- ▶ Maximize probability of mission success
- ▶ Components tested individually first

# Future

---

- ▶ Include final redundancy – Summer 2007
- ▶ Flight qualification plans – Summer 2007
- ▶ Individual component qualification – Summer 2007
- ▶ Qualification review – Fall 2007

# Payload

Justin Van Cleave, Payload

# Overview

---

- ▶ GaN based “visible blind”
  - ▶ Almost no response from visible light
- ▶ Key characteristics
  - ▶ Responsivity (325nm):  $\sim 0.1$  A/W
  - ▶ UV/V selectivity:  $\sim 10^6$
  - ▶ Dark current density @10V:  $\sim 0.8$  nA/cm<sup>2</sup>

# Purpose

---

- ▶ **Effectiveness**
  - ▶ Space environment
  - ▶ Mission lifespan
- ▶ **Future work**
  - ▶ Build circuit to measure current
  - ▶ Design housing and lens for cell

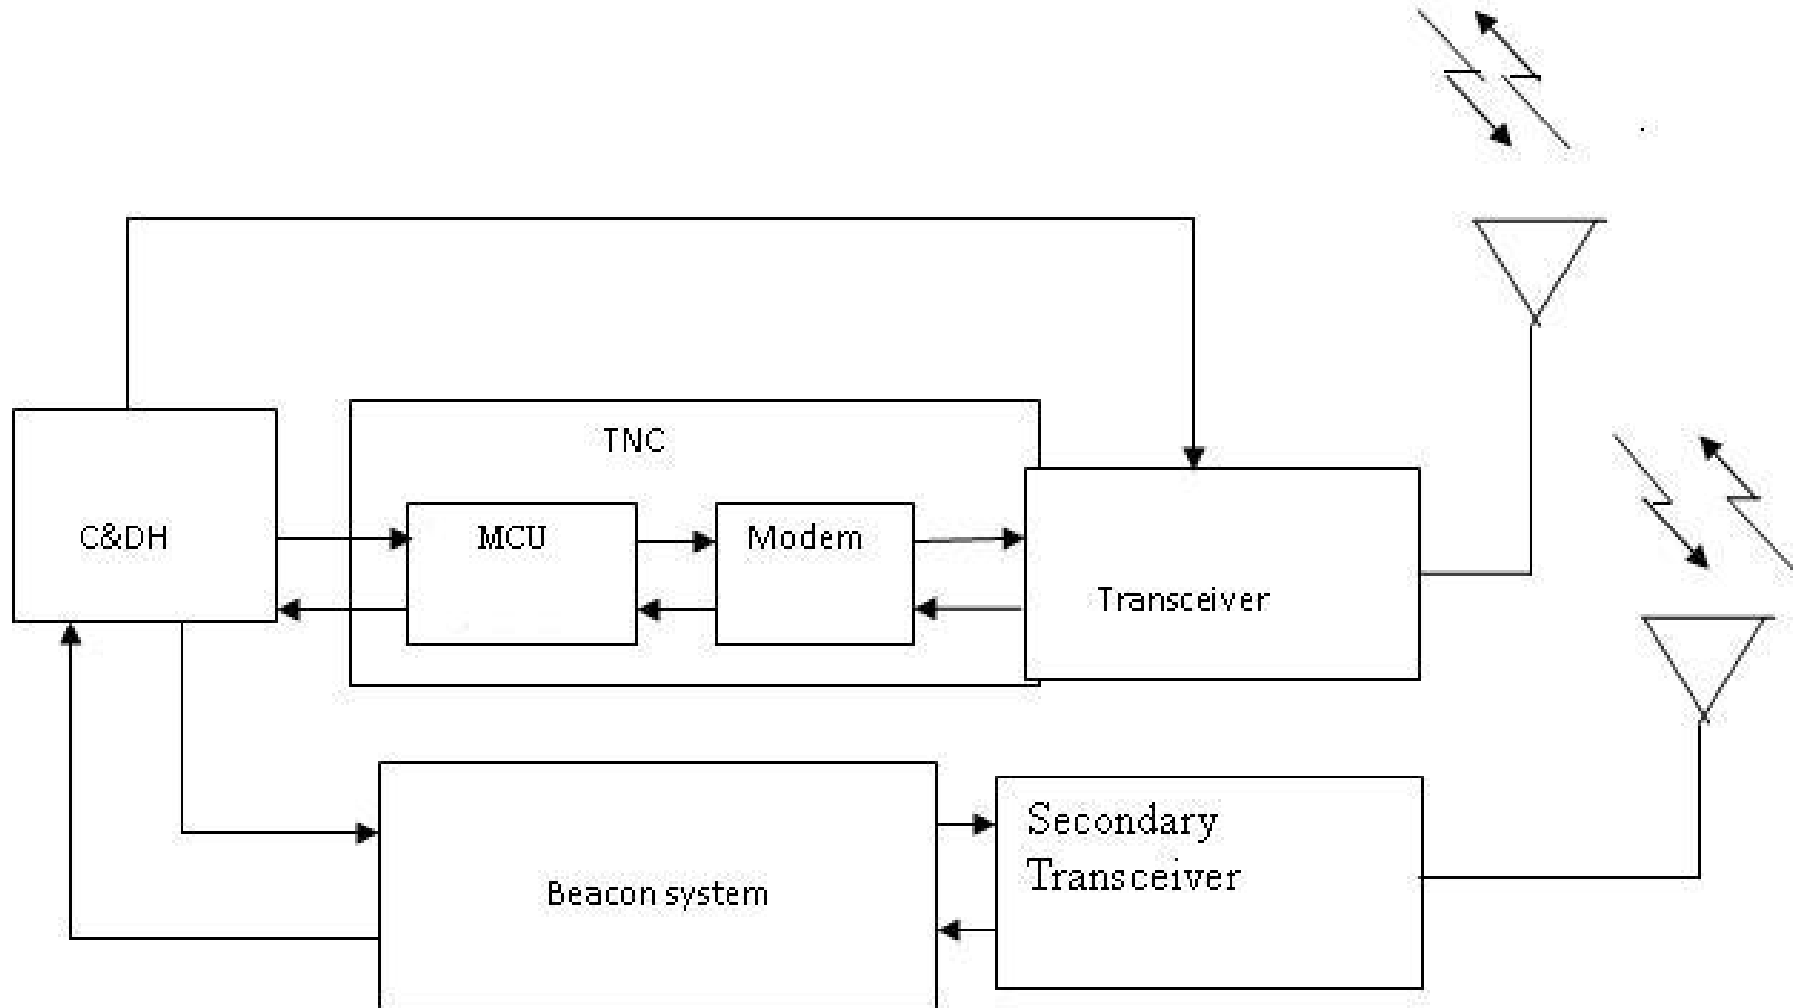

# Communications

Robert Thompson/Thor Wilson, Communications

# Functional Block Diagram

# Antenna

- ▶ Center feed half-wave dipole
- ▶ Amateur Band frequency 435-438 MHz
- ▶ Approximately 34 cm
- ▶ Made of Nitinol

# Nitinol

- ▶ **Super Elastic Wire**
  - ▶ Shape memory alloy
- ▶ **Conductivity**
  - ▶ Nitinol  $1.27 \times 10^4$
  - ▶ Copper  $5.81 \times 10^7$
  - ▶ Rubber  $1 \times 10^{-13}$
- ▶ **Diameter**
  - ▶ .027 in

# VX-2R

- ▶ FM Transceiver
- ▶ Power Output
  - ▶ 2 W
    - ▶ 6 V
    - ▶ 1.5 A
  - ▶ 1 W
    - ▶ 3.7 V
    - ▶ 1.2 A
- ▶ Structure (estimated)
  - ▶ Mass 41 g
  - ▶ Size 43 x 73 x 10 mm

# PicoPacket

- ▶ PicoPacket
  - ▶ Z80181 Microprocessor
  - ▶ TCM3105 Modem
  - ▶ Mass: 63 g
  - ▶ Volume: 8x6x1.2 cm
  - ▶ Voltage: 7-14 V
  - ▶ Current: 50-70 mA
  - ▶ Data Rate: 1200 baud

# Beacon

---

- ▶ **Function**
  - ▶ Help tracking
  - ▶ Provides secondary communications
  
- ▶ **Basic hardware**
  - ▶ CW transmitter
  - ▶ Morse code generator
  
- ▶ **Still in design phase**

# Electrical Power System

Michael Carroll, EPS

# Block Diagram

# Standard Orbit

**Std Orbit Power Graph**

# COMM Orbit

**Comm Orbit**

# Power Supply

- ▶ Power is supplied by solar cells on 5 faces of the satellite.
- ▶ Each face has two 26.8% efficiency solar cells.
- ▶ Each face has an open circuit voltage of 4.4V.

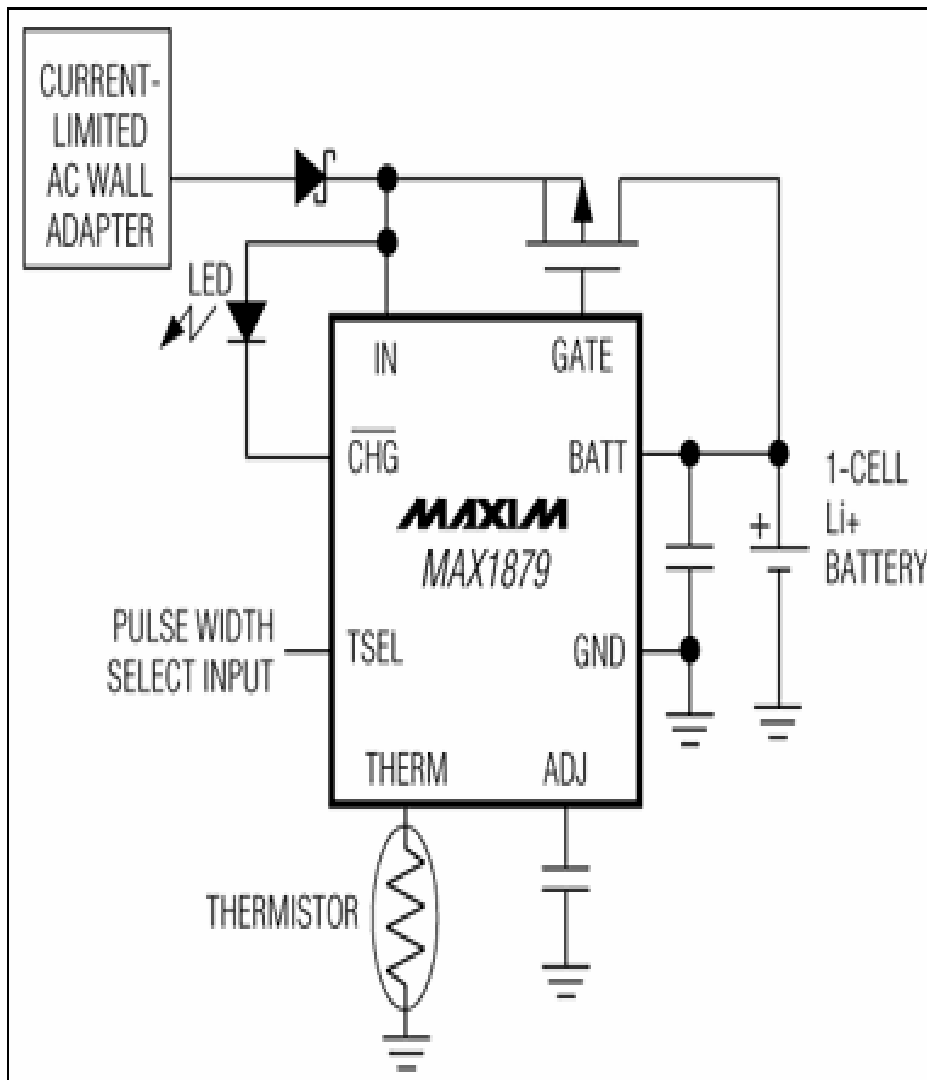

# Energy Storage

- ▶ Two Lithium-Ion batteries will be used to store energy.
- ▶ Each battery is rated for 1.7Ah, which is roughly 18,115 Joules, under specific conditions.
- ▶ The open circuit voltage on the batteries is 3.7V
- ▶ The batteries are connected in parallel to provide peak current.

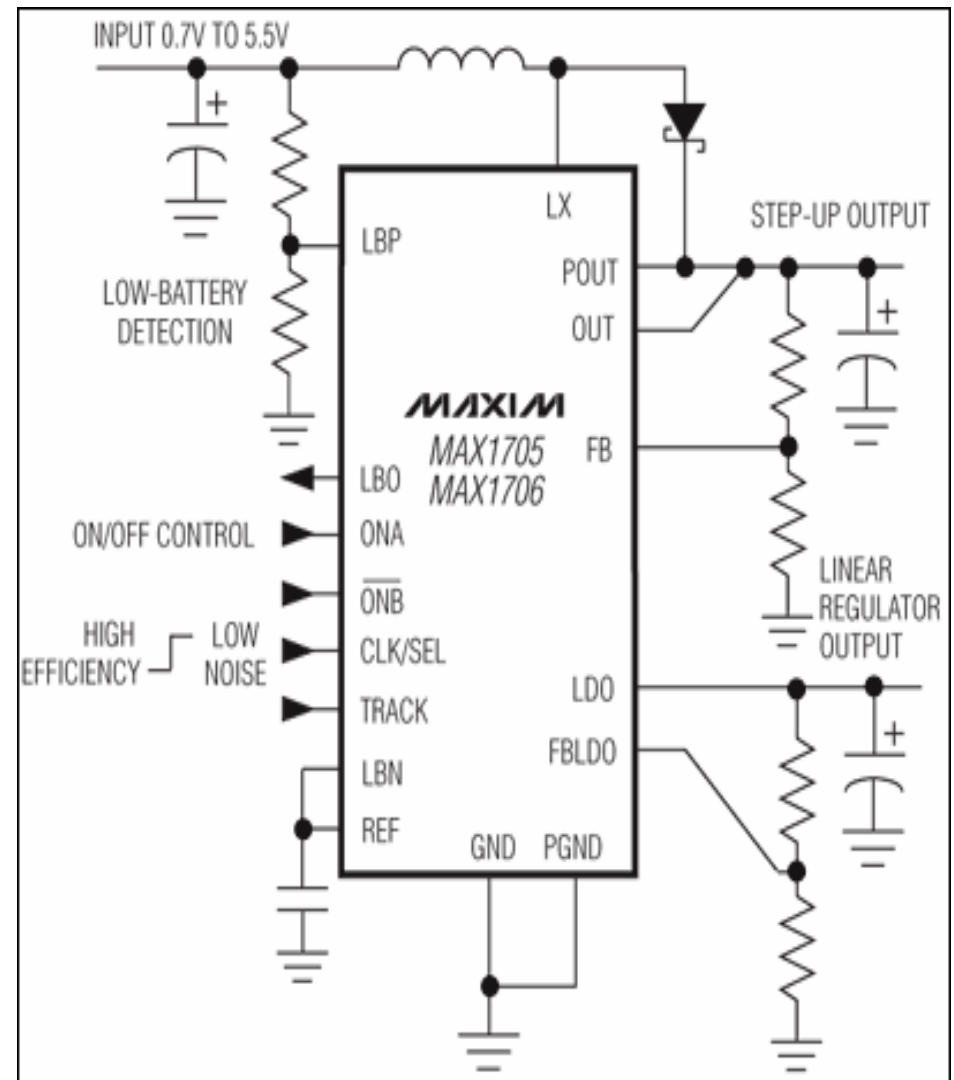

# Battery Regulators

- ▶ Each battery will be regulated by the Maxim 1879 Li-Ion regulator.
- ▶ The MAX1879 was selected for its over-voltage, under-voltage and temperature protection.
- ▶ Also an easy to assemble, proven circuit.

# 3.3V/4.5V Regulator

- ▶ The 3.3V and 4.5V regulated busses are provided by the MAX1705.
- ▶ Multiple regulators are used to provide peak current and redundancy.
- ▶ 3.3V is provided on LDO and 4.5V is on POUT as a by-product.

# 12V Regulation

- ▶ The 12V bus is provided by the MAX1771
- ▶ The MAX1771 was selected for its high efficiency.

# Attitude Determination and Control

Justin Van Cleave, ADC

# Mission

---

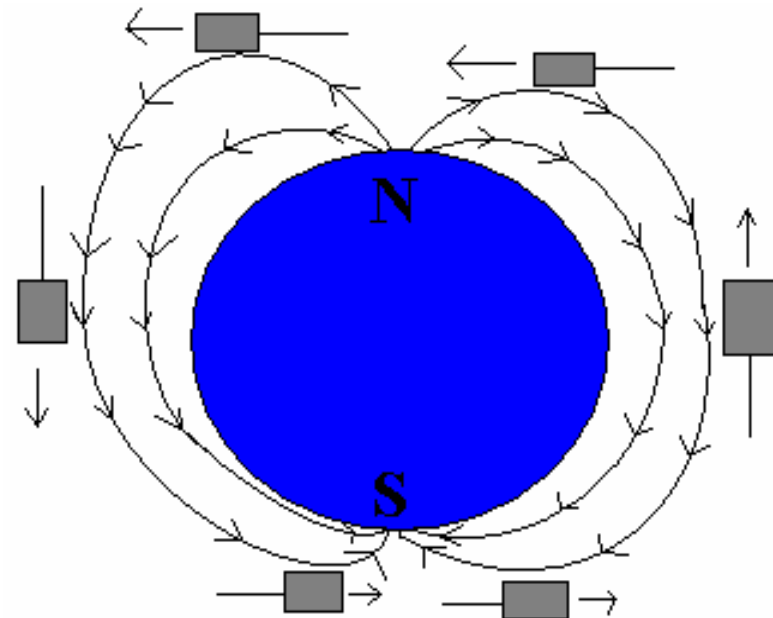

- ▶ Provide proper orientation for:
  - ▶ Battery Charging
  - ▶ Communication
  - ▶ Payload

# Magnetic Control

- ▶ Passive
- ▶ Alnico 5 magnets
- ▶ Resistant Forces
  - ▶ Gravity Gradient  $\sim 10^{-9}$  Nm
  - ▶ Air Drag  $\sim 10^{-10}$  Nm
  - ▶ Solar Pressure  $\sim 10^{-10}$  Nm

- Required Torque  $\sim 10^{-6}$  Nm
- Required dipole moment  $\sim .048$  Am<sup>2</sup>
- Dipole moment of magnet = .055 Am<sup>2</sup>

# Hysteresis Dampening

- Loop work provides dampening force.
- Ni/Fe/Mo Permalloy from Goodfellow

# Determination

---

- ▶ Passive system requires no determination
- ▶ Use of “course sun-sensor”
  - ▶ Based on data transmission constraints.

# System Orientation

# Future Work

---

- ▶ Fabrication of dampener
- ▶ Orbital Calculations
- ▶ Risk analysis

# Structures & Mechanisms

Zach Johnston/Neil Dougherty, Structures

# Data Summary

---

- ▶ Mass of Structure: 332.44 grams
- ▶ Allotted Mass Budget: 400 grams
- ▶ Center of Mass: x-direction .65mm  
y-direction 3.51mm  
z-direction .41mm
- ▶ Allowed Center of Mass Margin: 2 cm

A1	Revised CubeSat Specification.	Nash Clemens 7/25/04
B	Layout and notes modifications.	Armen Toorian 7/30/04

- Additional Notes:**
- No external components other than the rails may touch the inside of the P-POD.
  - Must incorporate a Remove Before Flight pin OR launch with batteries fully discharged.
  - Components on shaded sides may not extend more than 6.5 mm normal to the surface.
  - Rails must be either hard anodized OR made of a material other than aluminum.
  - Separation Springs (required) can be found at McMaster Carr (P/N: 84985A76)
  - At least one (1) deployment switch must be incorporated on all CubeSats.
  - CubeSats cannot weigh more than 1 kg.
  - Center of gravity must be less than 2 cm from the geometric center.

All dimensions in millimeters unless otherwise noted. Round all edges and corners. +/- 0.1 mm or better.	Part Name:	CubeSat Specification	Revision:	B

---

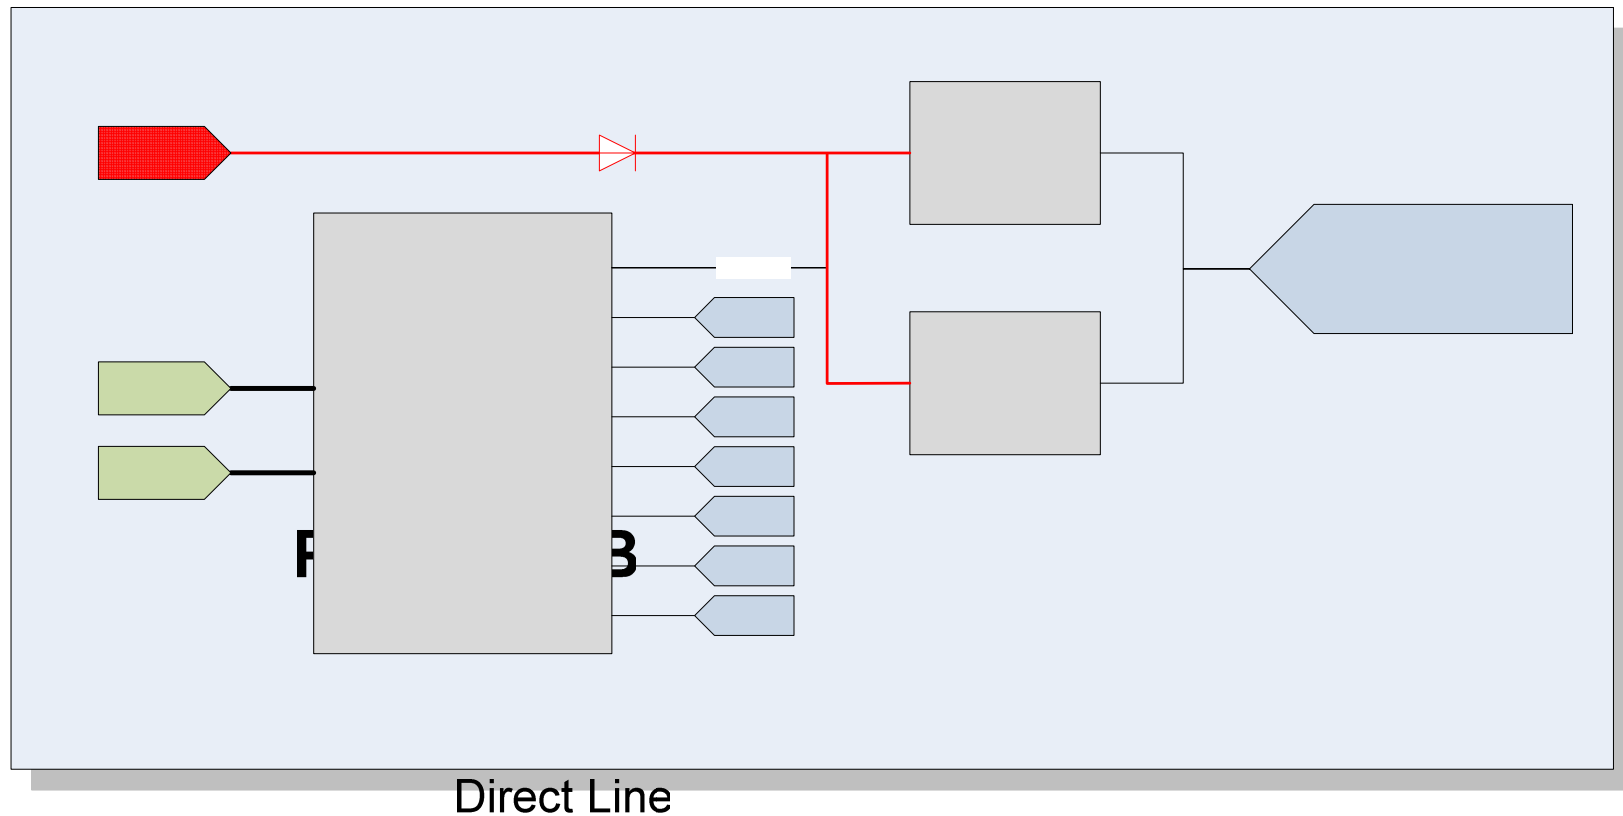

C&DH Properties Summary V1.0			
Mass	60.7	grams	
Power Consumption	68.6	mW	maximum
Tallest Component	5	mm	3V power relay

# Direct Control of Critical Relays

# Redundant Critical Relays

# Radiation Trade Study

## Radiation Trade Study

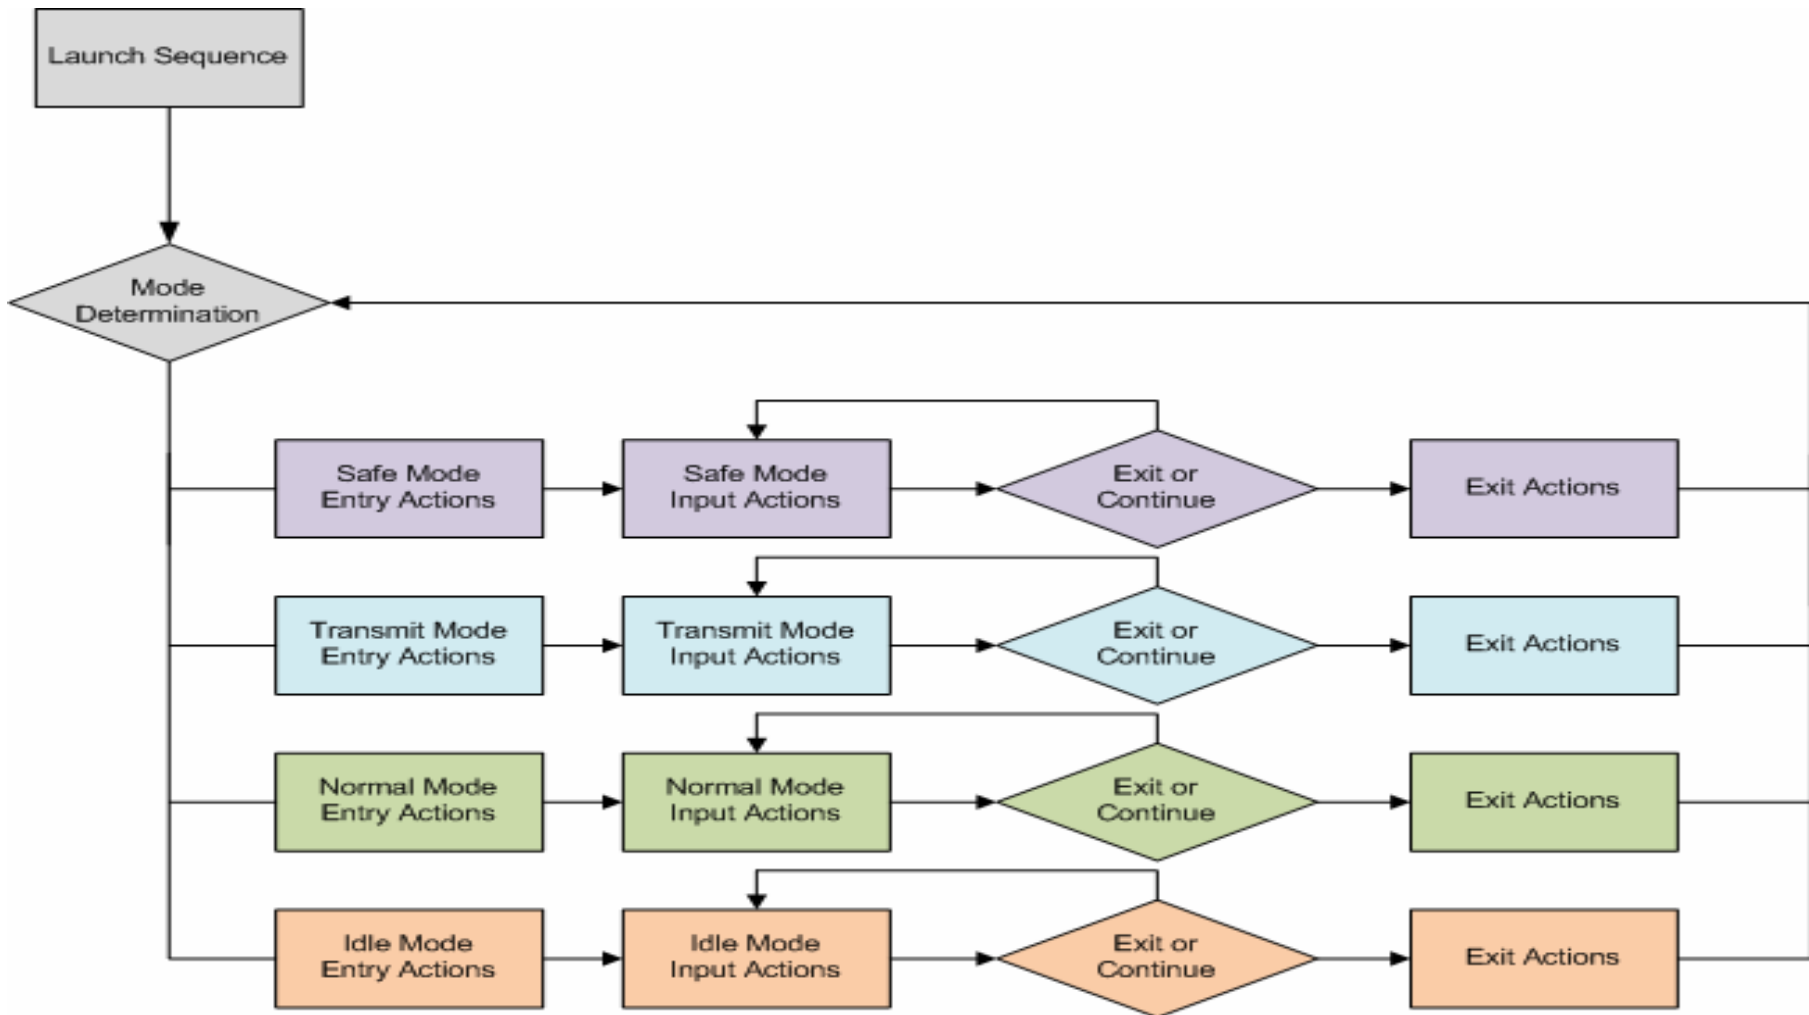

Option	Pros	Cons	Decision	Conclusion
Radiation Hardened Chips	High resistance to radiation	Expensive	No	Too expensive for project scope
Physical shielding	Possibly prevent some radiation exposure	Expensive, heavy, and hard to test.	No	Too expensive and cumbersome in design
Hardware redundancy	Best chance to avoid system failure against radiation	Requires more hardware	Yes	This will be our best chance to safe guard against radiation
Redundant Software Design	Could allow for self checking and error prevention	Complicated and resource intensive	Yes	This has potential to help prevent system failure without much cost
Self healing/correcting software	Could allow self mitigation and healing	Very complicated, possibly too intensive for our microtroller	No	Too complicated and not commonly used on microcontrollers

# Operating System

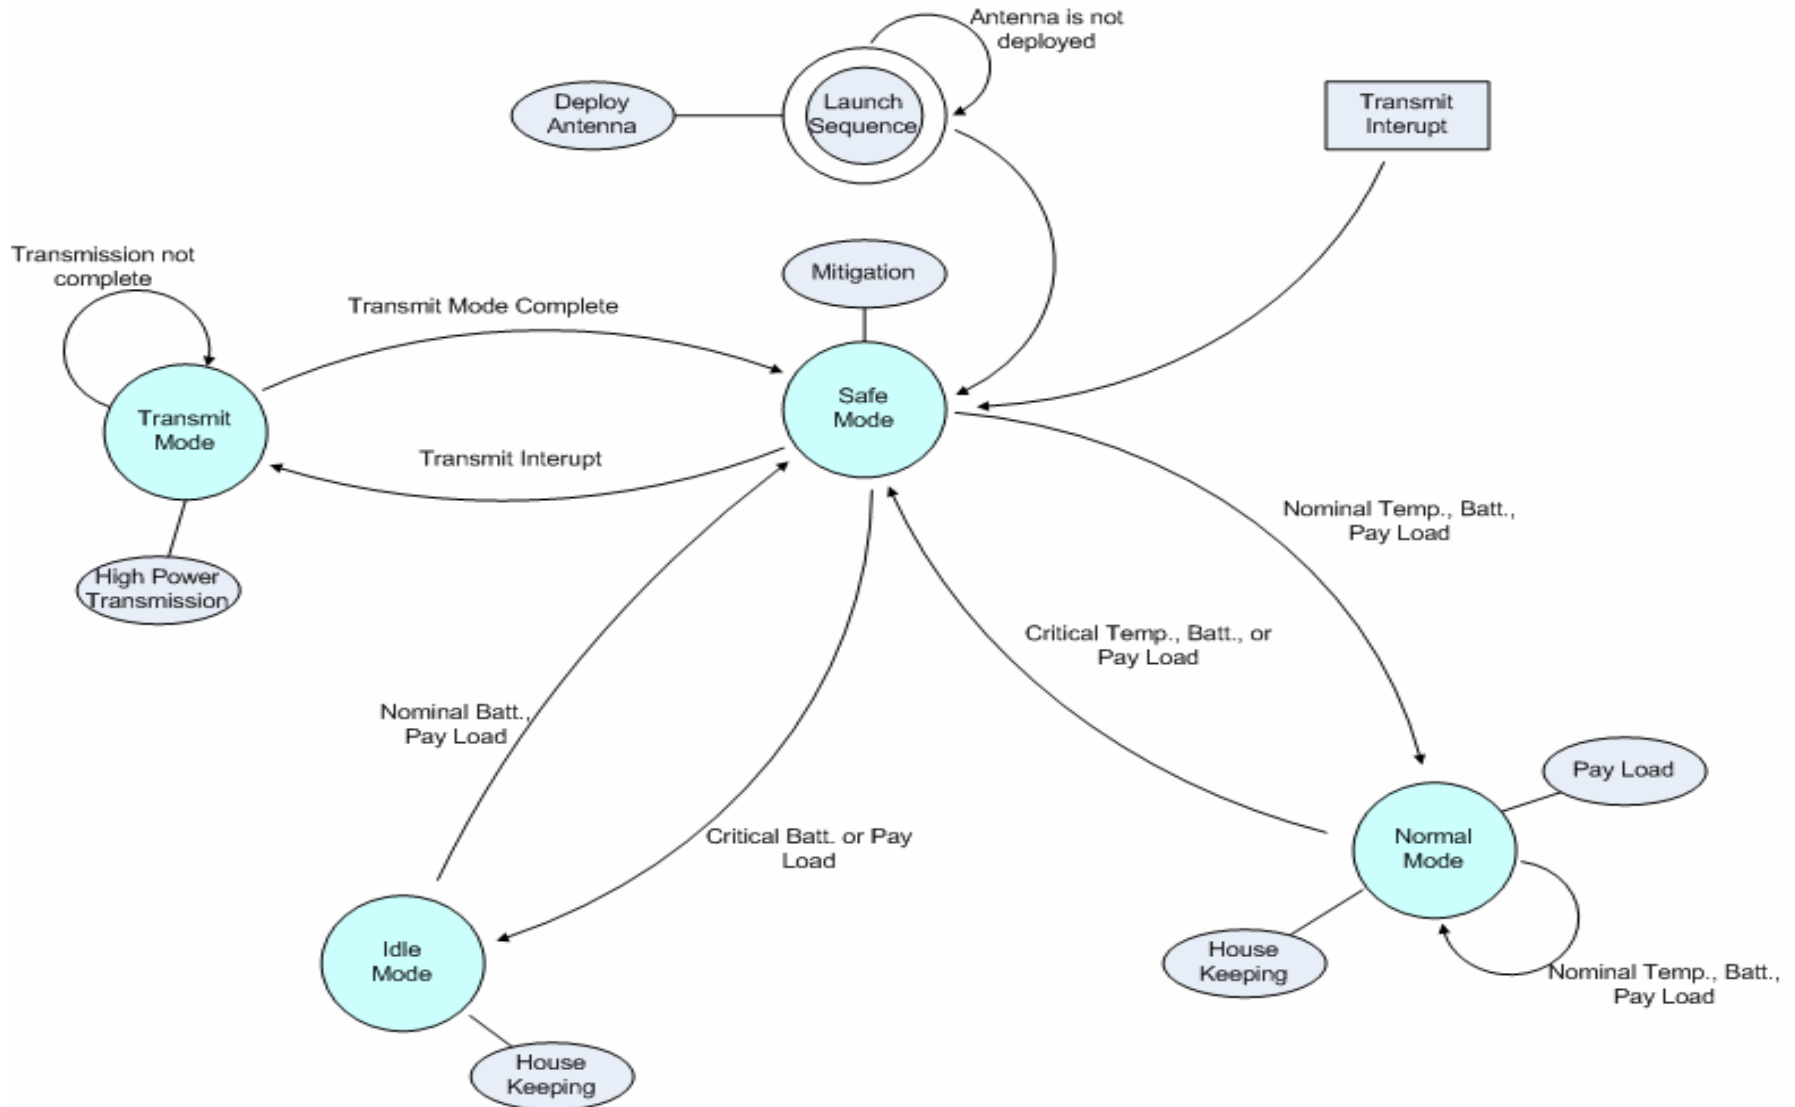

Feature	RTOS	Procedural OS
Resource usage	High	Low
Scheduling	Yes	No
Multi-Tasking	Yes	No
Threading	Yes	No
Design	Complex	Simple
Light weight design	No	Yes
Design knowledge	Documentation	Our design

# Ham Radio Deluxe

- ▶ Provides software control for transceiver
- ▶ Main purpose: Doppler shift correction
  - ▶ Uses Keplerian elements to predict frequency change.

# UI-View

- ▶ Not satellite-based.
- ▶ Send and receive messages on the local APRS network.
- ▶ Track other ground stations.

# Future Work

---

- ▶ Develop ground support software to extract satellite information from packets.
- ▶ Integrate NOVA, HRD, and new logging program using DDE-capabilities.
- ▶ And, of course, track more satellites.
