AIAA/USU 13th Annual Summer CubeSat Developers' Workshop

Millennium Engineering
and Integration Company

Modulating Retro-Reflectors would provide high data rate optical communication without strict pointing constraints

Goal: Provide high-speed comm. to low fidelity spacecraft

Advantages to standard RF and optical communications:

High-rate communication for CubeSats and larger:

- a. Low on-board power consumption
- b. Coarse on-board pointing requirements ($\pm 15^\circ$)
- c. Solves RF spectrum allocation issues using tight beam communications
- d. Improved security due to tight beam

Relevance:

Advances in comm. without imposing additional requirements to spacecraft

→ potential for crosscutting benefits to multiple missions

A non-modulating Retro-Reflector aboard PhoneSat 2.4 has been laser tracked by EOS Space Systems

PhoneSat 2.4

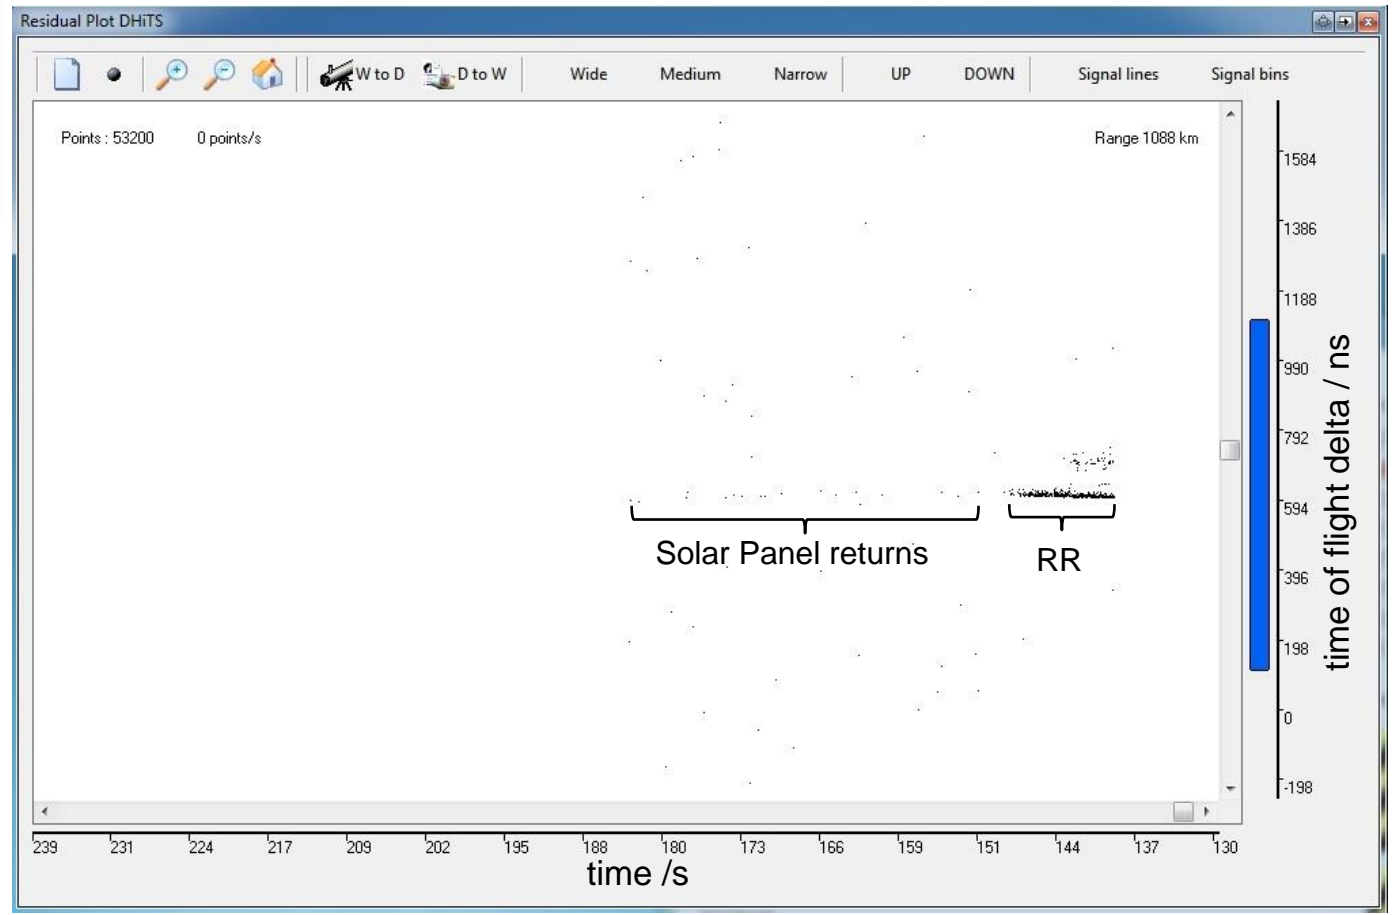

Passive Retro-Reflector
(7mm diameter)

EOS Laser debris ranging station

Tracking results allow distinction between reflections from solar panels and the retro-reflector

Source: EOS Space Systems

Link Budget for Modulating Retro-Retroreflector is challenging for ground stations

$$P_{\text{rec}} = P_{\text{laser}} G_{\text{T}} L_{\text{T}} L_{\text{R}} T_{\text{atm}} G_{\text{MRR}} M L_{\text{R}} T_{\text{atm}} G_{\text{rec}} L_{\text{rec}}$$

- P_{rec} = received signal power
- P_{las} = transmitter power laser
- G_{T} = transmitter optical antenna gain
- L_{T} = transmitter losses
- G_{MRR} = MRR optical antenna gain
- L_{MRR} = MRR optical losses
- M = modulation efficiency
- G_{rec} = receiver optical antenna gain
- L_{rec} = receiver losses
- L_{R} = range losses
- T_{atm} = atmospheric transmission

Particularities of the MRR link:

- Transit the atmosphere twice: path losses \propto distance⁴
- MRR acts as a receiver and transmitter: $G_{\text{MRR}} \propto$ Diameter⁴

Example:

700km dist., 10kW laser, 30 μ rad divergence, 1cm MRR, 1.5m receiver, 1Mbps

	dB	linear
Tx Power (dBm)	70.0	10000
Tx Loss (dB)	-1.0	0.8
Tx Gain (dB)	105.5	3.6E+10
Range Loss (dB)	-258.3	1.5E-26
Atmospheric transmission (dB)	-0.5	0.9
Retro reflector gain (dB)	178.7	7.4E+17
Modulation efficiency (dB)	-7.8	0.2
Atmospheric transmission (dB)	-0.5	0.9
Range Loss (dB)	-258.3	1.5E-26
Velocity aberration	-2.5	0.6
Receiver Loss (dB)	-3.0	5.0E-01
Receiver Gain (dB)	132.9	1.9E+13
Received Power (dBm)	-44.7	3.4E-08
Receiver Sensitivity (dBm)	-67.0	2.0E-10
Margin (dB)	22.3	169
detector quantum efficiency		0.5
photons per bit		9.1E+04

Currently, MEMS and Multiple-Quantum-Well implementations of MRR are available

	MEMS	MQW
Advantages	<ul style="list-style-type: none"> •Broadband •High contrast 	<ul style="list-style-type: none"> •Speed: MHz+ •Power: 0.2W
Disadvantages	<ul style="list-style-type: none"> •speed ~100kHz •100V+ operating voltage 	<ul style="list-style-type: none"> •Temperature control required

Decision to explore MQW for current effort, because of higher speed

ISDEFE prototyped a MQW device at 1064 nm in order to utilize available kW class fiber lasers

MRR design goals

Parameter	Goal
Wavelength	1064 nm
Contrast	3:1
Modulation eff.	-7.8 dB
Data rate	5 Mbps
Driving Voltage	< 10 V
Power consumption	< 1 W

Industrial 10 kW laser

Source: IPG Photonics

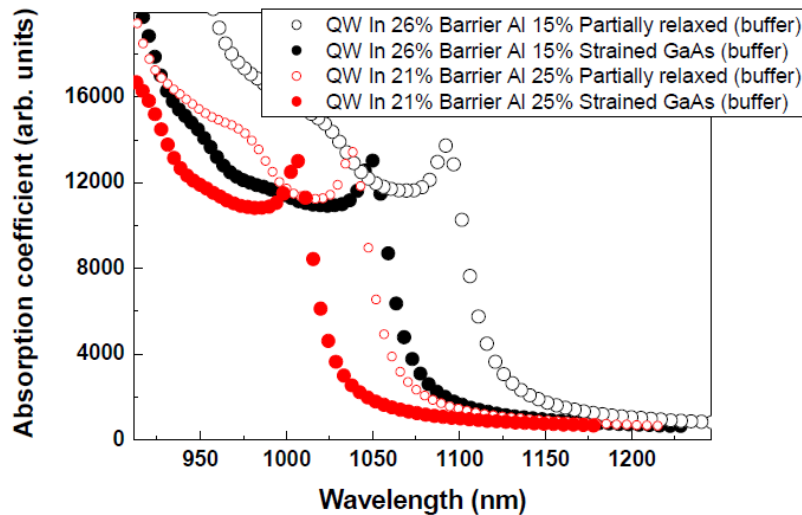

- Diffraction limited performance
- 1070 nm wavelength
- YAG fiber

ISDFE has a capability to simulate and optimize the optical properties of MQW

- Number of Quantum Wells: typically >50
- Active region (QWs):
 - Engineered accounting for quantum and excitonic effects
 - (In,Ga)As/(Al,Ga)As structure
 - Wells: High InAs mole fraction (>21%)
 - Barriers: designed to improve confinement (Al >10%)
- Added Anti-Reflex Coating and contacting

Simulation results:

ISDEFE's MQW MRR prototype modulates at 1064 nm, but material needs further optimization

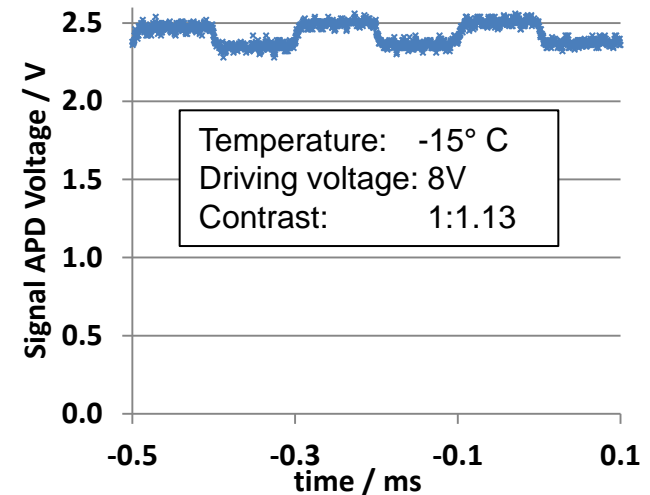

Measured Transmission

Assembled MRR

Modulated Signal

Tests at various temperatures:
→ Proof-of-concept that MQW at 1064 nm and 1070 nm is possible.

MRR driver electronics were developed at NASA Ames in parallel to the ISDEFE MQW prototyping effort

MRR driver design goals

Parameter	Design Goal
Data rate	20 MHz
Min/max voltage	Variable, 0...12 V
Form factor	1U compatible
Power consumption	< 1 W
Capabilities	<ol style="list-style-type: none">1. Comm. interface2. Independent payload

Driver electronics were developed to act both as an independent payload, or as a communication system

Carrier board:

- Hosts Raspberry Pi (main processor)
- Data connection to S/C (USB & UART)
- s/c power conversion (5..14V input)

Driver board:

- High speed current driver
- Sensor readout
- Hosts optional photodiodes
- Can be placed elsewhere

Summary

- 1) **Multiple Quantum Well modulation at 1064nm is possible with (In,Ga)As/(Al,Ga)As structures.**
- 2) **High performance operation of MRR will require further material optimization.**
- 3) **Versatile driver electronics can be fitted into cubesat form-factor.**
